L5 ANSWER 1 OF 31 CAPLUS COPYRIGHT 2007 ACS on STN
2007:533925 Document No. 146:524924 Enzyme electrodes containing immobilized
 π -conjugated metal complexes, sensors using them, and biofuel cells.
Kubo, Wataru; Nomoto, Takeshi; Yano, Tetsuya (Canon Inc., Japan). Jpn.
Kokai Tokkyo Koho JP 2007121280 A 20070517, 17pp. (Japanese). CODEN:
JPKXAF. APPLICATION: JP 2006-269646 20060929. PRIORITY: JP 2005-289106
20050930.

AB The title electrode consists of a conductive support containing an immobilized
 π -conjugated metal complex, where an enzyme is immobilized to the
substrate via the complex. The title sensor is equipped with the enzyme
electrode and a counter electrode. The title fuel cell is equipped with
the enzyme electrode as an anode and/or cathode and an electrolyte solution
The enzyme electrode provides high charge-transporting ability.

2007:483260 Document No. 147:85536 Luminescent supramolecular polymers:
Cd2+-directed polymerization and properties. Chen, Xuegang; Ma, Liang;
Cheng, Jianxiang; Xie, Zhiyuan; Wang, Lixiang (College of Polymer Science
and Engineering, Key Laboratory of Rubber and Plastic of Ministry of
Education, Qingdao University of Science and Technology, Qingdao, 266042,
Peop. Rep. China). Polymer International, 56(5), 648-654 (English) 2007.
CODEN: POLYIEI. ISSN: 0959-8103. Publisher: John Wiley & Sons Ltd..

AB A family of supramol. polymers was prepared via Cd2+-directed self-assembly
polymerization of bis(2,2',6',2'''-terpyridine)-based ligand monomers, using
oligofluorenes and triphenylamine as bridges under mild conditions. The
polymers were fully characterized using TGA, inherent viscosity,
electrochem. measurements, UV-visible spectroscopy, photoluminescence (PL)
and electroluminescence (EL). Polymers with oligofluorenes as spacers
exhibited blue emission (434-442 nm) in di-Me acetamide (DMAC) solution,
while polymers with triphenylamine as spacer presented an emission peak at
494 nm in DMAC solution. Complexation polymerization of
bis(2,2',6',2'''-terpyridine)-
based ligand monomers with Cd(II) improved fluorescence quantum yields
dramatically, and the film PL quantum yields of these polymers were
apprx.0.38-0.54. Single-layer light-emitting diodes were fabricated with
the configuration in Sn oxide (ITO)/polymer/Ca/Al: the EL showed green
emission and the onset voltages of the devices were 8-11 V.

2006:1302754 Document No. 146:184123 Theoretical investigation of the second-order nonlinear optical properties of helical pyridine-pyrimidine oligomers. Botek, Edith; Castet, Frederic; Champagne, Benoit (Laboratoire de Chimie Theorique Appliquee, Facultes Universitaires Notre-Dame de la Paix, Namur, 5000, Belg.). Chemistry--A European Journal, 12(34), 8687-8695 (English) 2006. CODEN: CEUJED. ISSN: 0947-6539. Publisher: Wiley-VCH Verlag GmbH & Co. KGaA.

AB The structure and second-order nonlinear optical properties of a series of helical pyridine-pyrimidine oligomers recently synthesized by Barboiu and Lehn have been investigated theor. by combining mol. mechanics and quantum chemical approaches in the absence of substituents, the hyper-Rayleigh scattering response (HRS) and the projection of the first hyperpolarizability on the dipole moment (P.dbivert.) exhibit periodic variations with chain length, but these non-linear optical responses remain small. The first hyperpolarizabilities can, however, be enhanced by adding substituents. The greatest enhancement is obtained by substituting the pyrimidine groups by donor groups. Moreover, regular distributions of the donor groups around the helices enable the design of supramol. structures exhibiting dipolar, octupolar or A-shaped nonlinear optical characters, evident from the values of the depolarization ratios in hyper-Rayleigh scattering. Therefore this theor. investigation demonstrates the potential of helical structures for the organization of chromophores in such a way that they exhibit large and specific second-order nonlinear optical responses.

L5 ANSWER 8 OF 31 CAPLUS COPYRIGHT 2007 ACS on STN
2006:712066 Document No. 145:347239 Design, synthesis and photoelectrochemical properties of hexagonal metallomacrocyclics based on triphenylamine: [M(4,4'-bis(2,2':6',2''-terpyridinyl)triphenylamine)]₆(X)₁ 2]; [M = Fe(II), PF₆⁻ and Zn(II), BF₄⁻]. Hwang, Seok-Ho; Moorefield, Charles N.; Wang, Pingshan; Fronczek, Frank R.; Courtney, Brandy H.; Newkome, George R. (Departments of Polymer Science and Chemistry, The University of Akron, Akron, OH, 44325-3909, USA). Dalton Transactions (29), 3518-3522 (English) 2006. CODEN: DTRAF. ISSN: 1477-9226. OTHER SOURCES: CASREACT 145:347239. Publisher: Royal Society of Chemistry.

AB Synthesis of a novel bis(terpyridine) ligand, 4,4'-bis(2,2':6',2''-terpyridinyl)triphenylamine (2), using triphenylamine as a specific angle controller, led to the self-assembly of a unique hexagonal metallomacrocyclic family, [Fe(2)6(PF₆)₁₂] and [Zn6(2)6(BF₄)₁₂], using terpyridine-metal(II)-terpyridine connectivity. The crystal structure of the novel ligand shows that the angle between the two terpyridinyl moieties is 119.69°, which enabled the formation of the hexagonal-shaped macrocycles. The crystal packing architectures of this starting ligand revealed channels induced by solvent encapsulation. Following complexation of this ligand with transition metals [Fe(II) or Zn(II)] in a 1-pot reaction, the resultant structures were characterized by IR and ¹³C NMR, UV/visible and mass spectroscopies. The expected metal-to-ligand charge transfer (MLCT; λ_{max} = 582 nm) and emission (λ_{em} = 575 nm) characteristics were exhibited by both [Fe(2)6(PF₆)₁₂] and [Zn6(2)6(BF₄)₁₂]. The photoelectrochemical characteristics of these hexagonal metallomacrocyclics demonstrate that they can be used as sensitizers in dye-sensitized solar cells.

2006:476202 Document No. 145:155911 Conformationally Gated Photoinduced Processes Within Photosensitizer-Acceptor Dyads Based on Osmium(II) Complexes with Triarylpyridinio-Functionalized Terpyridyl Ligands: Insights from Experimental Study. Laine, Philippe P.; Bedioui, Fethi;

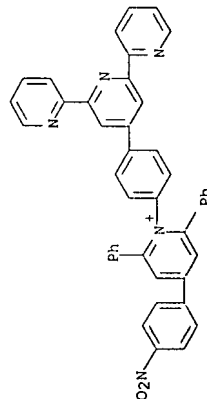

Loiseau, Frederique; Chiorboli, Claudio; Campagna, Sebastiano (Laboratoire de Chimie et Biochimie Pharmacologiques et Toxicologiques, CNRS UMR-8601, Universite Rene Descartes, Paris, F-75270, Fr.). Journal of the American Chemical Society, 128(23), 7510-7521 (English) 2006. CODEN: JACSAT. ISSN: 0002-7863. OTHER SOURCES: CASREACT 145:155911. Publisher: American Chemical Society.

AB The comps.: [(tppy)Os(tpy-ph-TPH3+)]3+ (2), [(tppy)Os(tpy-xy-TPH3+)]3+ (3), [(tppy)Os(tpy-ph-TPH2(NO2+))]3+ (4), and [(tppy)Os(tpy-xy-TPH2(NO2+))]3+ (5) are series of dyads made of an Os(II) bis-tpy complex (tpy = 2,2':6',2''-terpyridine; tpy = 4'-tolyl-tpy) as the photosensitizer (P) and 2,4,6-triarylpyridinium group (TP+) as the electron acceptor (A) and spacer (xy, ph = xylol, phenyl). These dyads were designed to form charge-separated states (CSS) upon light excitation. Together with analogous Ru(II) complexes, they have been synthesized and fully characterized. The authors describe how intramol. photoinduced processes are affected when the electron-accepting strength of A (by nitro-derivatization of TP+) and/or the steric hindrance about intercomponent linkage (by replacing a Ph spacer by a xylol one) are changed. Electronic absorption and electrochem. behavior revealed that (i) chemical substitution of TP+ (i.e., TP+NO2) has no sizable influence on P-centered electronic features, (ii) reduction processes located on TP+ depend on the intercomponent tilt angle. Concerning excited-state properties, photophys. investigation evidenced that phosphorescence of P is actually quenched in dyads 4 and 5 only. Ultrafast transient absorption (TA) expts. allowed attributing the quenching in conformationally locked dyad 5 to oxidative electron transfer (ET) from the 3MLCT level to the TP+NO2 acceptor ($k_{et} = 1.1 \times 10^9$ s⁻¹). For 4, geometrically unlocked, the 3MLCT state was shown to first rapidly equilibrate (reversible energy transfer; $k_{eq} \approx 2 \times 10^9$ s⁻¹) with a ligand centered triplet state before undergoing CSS formation. Thus, the pivotal role of conformation in driving excited-state decay pathways is demonstrated. Also, inner P structural planarization as a relaxation mode of the 3MLCT states has been inferred from TA expts.

AB A nonaq. CE system for separation and detection of novel electron-dopable mol.
wires based on p-phenylene-bis-4,4'-(1-aryl-2,6-diphenylpyridinium)
oligomers is described. The method is based on the coupling of CE separation
in pure organic solvent, DMF with 50 mM acetic acid, and UV detection at 338
nm. The system offers a rapid measurement in <20 min for two priority
nanowires and their impurities. Calibration data confirmed linear
response for all compds. of interest in the concentration range 0.1-1.0 mg/mL.

A highly stable response was observed for repetitive injections (relative
standard deviation $\leq 2.8\%$, $n = 10$).

ISSN: 0366-7022. Publisher: Chemical Society of Japan.

AB Defect-free structures of a film composed of linear redox polymer chains
were prepared using stepwise complexation of Fe(II) and/or Co(II/III) ions
with π -benzene-bridged bis(tpy) (tpy = 2,2':6',2''-terpyridine) ligands,
tpy-AB-tpy, on tpy-terminated SAM on Au. This method realizes a formation
of the desired number of polymer units (for example, 47-mer of Co(tpy)2) and
a desired sequence of Co-Fe heterometal structures in the polymer chain
(for example, 10-mer of Co(tpy)2 plus 5-mer of Fe(tpy)2).

GI

AB The synthesis and spectral characterization of the first five members of
 an oligomeric series built from alternating p-connected 1,4-benzene and
 1,4-pyridinium rings, I [R = R1 = H, NH2, NHAc; R = NHAc; R1 = NH2; n =
 1-5], with p-phenylene-bis-4,4'-(1-aryl-2,6-diphenylpyridinium) (extended
 viologen) as the repeating unit is reported. The lengths of these rodlike
 moles. range from 2 to 9 nm. The monomer was obtained from
 p-phenylene-bis-4,4'-(2,6-diphenylpyridinium) and p-phenylenediamine or
 p-aminocetanilide. Higher oligomers were synthesized by stepwise
 elaboration of the monomer by reactions with the appropriate bis-pyrylium
 or pyrylium-phenylene-pyridinium salts. Eight different counterions were
 used, and dodecamethylcarba-closo-dodecaborate was found to offer
 particularly favorable solubility characteristics. UV absorption spectra of
 the oligomers suggest that the individual extended viologen segments
 interact only weakly, as a result of the strongly twisted orientation of
 the benzene rings that sep. them. The UV spectrum of the monomer was
 interpreted by comparison with semiempirical INDO/S calcns. performed at a
 DFT optimized geometry.

CODEN: PUYIEI. ISSN: 0959-8103. Publisher: John Wiley & Sons Ltd.

AB A family of supramol. polymers was prepared via Cd2+-directed self-assembly
polymerization of bis(2,2'-(6',2'')-terpyridine)-based ligand monomers, using
oligofluorenes and triphenylamine as bridges under mild conditions. The
polymers were fully characterized using TGA, inherent viscosity,
electrochem. measurements, UV-visible spectroscopy, photoluminescence (PL)
and electroluminescence (EL). Polymers with oligofluorenes as spacers
exhibited blue emission (434-442 nm) in di-Me acetamide (DMAc) solution,
while polymers with triphenylamine as spacer presented an emission peak at
494 nm in DMAc solution. Complexation polymerization of

bis(2,2'-(6',2'')-terpyridine)-
based ligand monomers with Cd(II) improved fluorescence quantum yields
dramatically, and the film PL quantum yields of these polymers were
apprx.0.38-0.54. Single-layer light-emitting diodes were fabricated with
the configuration in Sn oxide (ITO)/polymer/Ca/Al; the EL showed green
emission and the onset voltages of the devices were 8-11 V.

II (X = any group given for X in I), or their salts, useful as intermediates for charge-transfer complexes, drugs, agrochems., catalyst ligands, combinatorial chemical, electrophotog. photoreceptors, dyes, etc., are prepared thus, Me2NCO(CHO):CHNMe2, prepared from DMF and AcNMe2, was

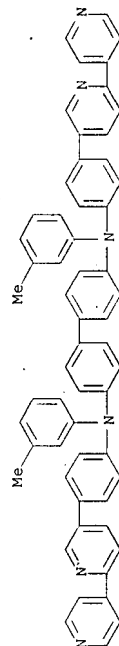

reacted with 4-acetylpyridine in THF at room temperature and further treated with AcOH and AcONH₄ at 95° to give N,N-dimethyl-2,4'-bipyridine-5-carboxamide. This was reacted with aqueous H₂NNH₂ solution under reflux and the resulting 2,4'-bipyridine-5-carboxhydrazide was N-benzoylated with 4-Me3CC6H4COCl and cyclized to give 5-[5-(4-tert-butylphenyl)-1,3,4-oxadiazol-2-yl]-2,4'-bipyridine. This compound had optical characteristics useful as organic electroluminescent materials.

2006:1302754 Document No. 146:184123 Theoretical investigation of the second-order nonlinear optical properties of helical pyridine-pyrimidine oligomers. Botek, Edith; Castet, Frederic; Champagne, Benoit (Laboratoire de Chimie Theorique Appliquee, Facultes Universitaires Notre-Dame de la Paix, Namur, 5000, Belg.). Chemistry--A European Journal, 12(34), 8687-8695 (English) 2006. CODEN: CEUJED. ISSN: 0947-6539. Publisher: Wiley-VCH Verlag GmbH & Co. KGaA.

AB The structure and second-order nonlinear optical properties of a series of helical pyridine-pyrimidine oligomers recently synthesized by Barboiu and Lehn have been investigated theor. by combining mol. mechanics and quantum chemical approaches. In the absence of substituents, the hyper-Rayleigh scattering response (PHRS) and the projection of the first hyperpolarizability on the dipole moment (β_{||}divert.) exhibit periodic variations with chain length, but these non-linear optical responses remain small. The first hyperpolarizabilities can, however, be enhanced by adding substituents. The greatest enhancement is obtained by substituting the pyrimidine groups by donor groups. Moreover, regular distributions of the donor groups around the helices enable the design of supramol. structures exhibiting dipolar, octupolar or λ-shaped nonlinear optical characters, evident from the values of the depolarization ratios in hyper-Rayleigh scattering. Therefore this theor. investigation demonstrates the potential of helical structures for the organization of chromophores in such a way that they exhibit large and specific second-order nonlinear optical responses.

AB Synthesis of a novel bis(terpyridine) ligand, 4,4'-bis(2,2':6',2''-
 terpyridinyl)triphenylamine (2), using triphenylamine as a specific angle
 controller, led to the self-assembly of a unique hexagonal
 metallomacrocycle family, [Fe(2)6(PF₆)₁₂] and [Zn(2)6(BF₄)₁₂], using
 terpyridine-metal(II)-terpyridine connectivity. The crystal structure of
 the novel ligand shows that the angle between the two terpyridinyl
 moieties is 119.68°, which enabled the formation of the
 hexagonal-shaped macrocycles. The crystal packing architectures of this
 starting ligand revealed channels induced by solvent encapsulation.
 Following complexation of this ligand with transition metals [Fe(II) or
 Zn(II)] in a 1-pot reaction, the resultant structures were characterized
 by 1H and 13C NMR, UV/visible and mass spectroscopies. The expected
 metal-to-ligand charge transfer (MLCT; λ_{max} = 582 nm) and emission
 (λ_{em} = 575 nm) characteristics were exhibited by both
 [Fe(2)6(PF₆)₁₂] and [Zn(2)6(BF₄)₁₂]. The photoelectrochem-
 ical characteristics of these hexagonal metallomacrocycle demonstrate that
 they can be used as sensitizers in dye-sensitized solar cells.

AB The compds.: [(tpy)Os(tpy-ph-TPH3+)]³⁺ (2), [(tpy)Os(tpy-xy-TPH3+)]³⁺ (3), [(tpy)Os(tpy-ph-TPH2(NO2+))]³⁺ (4), and [(tpy)Os(tpy-xy-TPH2(NO2+))]³⁺ (5) are series of dyads made of an Os(II) bis-tpy complex (tpy = 2,2':6,6''-terpyridine; tpy = 4'-tolyl-tpy) as the photosensitizer (P) and 2,4,6-triarylpyridinium group (TP+) as the electron acceptor (A) and spacer (xy, ph = xyllyl, phenyl). These dyads were designed to form charge-separated states (CSS) upon light excitation. Together with analogous Ru(II) complexes, they have been synthesized and fully characterized. The authors describe how intramol. photoinduced processes are affected when the electron-accepting strength of A (by nitro-derivatization of TP+) and/or the steric hindrance about intercomponent linkage (by replacing a Ph spacer by a xyllyl one) are changed. Electronic absorption and electrochem. behavior revealed that (i) chemical substitution of TP+ (i.e., TP+NO2) has no sizable influence on P-centered electronic features, (ii) reduction processes located on TP+ depend on the intercomponent tilt angle. Concerning excited-state properties, photophys. investigation evidenced that phosphorescence of P is actually quenched in dyads 4 and 5 only. Ultrafast transient absorption (TA) expts. allowed attributing the quenching in conformationally locked dyad 5 to oxidative electron transfer (ET) from the 3MLCT level to the TP+NO2 acceptor (k_{et} = 1.1 × 10⁹ s⁻¹). For 4, geometrically unlocked, the 3MLCT state was shown to first rapidly equilibrate (reversible energy transfer; k_{eq} ≈ 2 × 10⁹ s⁻¹) with a ligand centered triplet state before undergoing CSS formation. Thus, the pivotal role of conformation in driving excited-state decay pathways is demonstrated. Also, inner P structural planarization as a relaxation mode of the 3MLCT states has been inferred from TA expts.

AB A preventive/therapeutic agent for diseases attributable to angiogenesis
which contains as an active ingredient a cyclic amine compound represented
by the general formula (I): (Chemical formula I) (wherein R1, R2, and R3
each independently represents hydrogen, halogeno, hydroxy, alkyl,
halogenoalkyl, alkoxy, alkylthio, carboxy, alkoxycarbonyl, or alkanoyl; W1
and W2 each independently represents nitrogen or CH; X represents oxygen,
NR4, CO2R4, or NR4CO; R4's each represents hydrogen, alkyl, alkenyl,

GI

AB The synthesis and spectral characterization of the first five members of
 an oligomeric series built from alternating p-connected 1,4-benzene and
 1,4-pyridinium rings, I [R = R1 = H, NH2, NHAc; R = NHAc, R1 = NH2; n =
 1-5], with p-phenylene-bis-4,4'-(1-aryl-2,6-diphenylpyridinium) (extended
 viologen) as the repeating unit is reported. The lengths of these rodlike
 mols. range from 2 to 9 nm. The monomer was obtained from
 p-phenylene-bis-4,4'-(2,6-diphenylpyridium) and p-phenylenediamine or
 p-aminobenzoic acid. Higher oligomers were synthesized by stepwise
 elaboration of the monomer by reactions with the appropriate bis-pyrylium
 or pyrylium-phenylene-pyridinium salts. Eight different counterions were
 used, and dodecamethylcarba-closo-dodecaborate was found to offer
 particularly favorable solubility characteristics. UV absorption spectra of
 the oligomers suggest that the individual extended viologen segments
 interact only weakly, as a result of the strongly twisted orientation of
 the benzene rings that sep. them. The UV spectrum of the monomer was
 interpreted by comparison with semiempirical INDO/S calcs. performed at a
 DFT optimized geometry.

L5 ANSWER 15 OF 31 CAPLUS COPYRIGHT 2007 ACS ON STN
2004:866542 Document No. 142:56763 Toward Nanoamphiphiles: Efficient
Synthesis of Desymmetrized Polyphenylene Dendrimers. Mihov, G.;
Schepelmann, I.; Muelken, K. (Max Planck Institute for Polymer Research,
Mainz, D-55128, Germany). Journal of Organic Chemistry, 69(23), 8029-8037
(English) 2004. COUEN: JOCEAH. ISSN: 0022-3263. OTHER SOURCES: CASREACT

142:56763. Publisher: American Chemical Society.

AB A new synthetic approach for the desymmetrization of polyphenylene dendrimers (PPDs) is described. Tetakis(4-ethynylphenyl)methane undergoes facile Diels-Alder cycloaddn. with substoichiometric quantities of tetraphenylcyclopentadienones bearing one polar functional group. A single ethynyl group is thereby converted to a rigid, selectively functionalized polyphenylene moiety, which serves as a focal point for further transformations or interfacial anchoring. This is the key feature for the design of desymmetrized monodisperse macromols. with a spherical shape. The remaining unreacted ethynyl groups provide a trifold core for the stepwise elaboration of first- and second-generation polyphenylene dendrons, which may, in turn, bear specific nos. of different peripheral functional groups at their terminae. Moreover, the resulting macromols. exhibit the characteristic shape-persistence and monodispersity of PPDs. This approach is an important achievement in nanosciences, especially for tailoring new nanoamphiphiles. It is also of synthetic importance, as it enables the separation of two regioisomeric polyphenylene dendrimers for the first time.

AB The title compds. I (R1-R3 = H, halo, alkoxy, etc.; W1, W2 = N, CH; X = O, NR4, COR4, NR4CO; R4 = H, alkyl, aryl, heteroaryl, aralkyl, heteroalkyl, etc.; and 1, m, and n each = 0-11) were prepared. For example, (3S)-11-4HCl was prepared in 68% yield by base-catalyzed condensation of (3S)-3-methylamino-1-[(2-(3,4,5-trimethoxyphenyl)pyridin-4-yl)methyl]pyrrolidine with 4-chloromethyl-2-(3,4,5-trimethoxyphenyl)pyridine and acidulation with HCl. Selective invention compds. showed IC50 values of 0.04 μ M to 0.3 μ M for inhibition of cell adhesion. I and their pharmaceutical compds. (2 examples given) are useful as anti-allergic, antithrombotic, antiasthmatic agents, etc.

GI

II

AB The present invention is directed to a method for treating cancer, a
 method for inhibiting histone deacetylase, and a method for facilitating
 gene therapy, comprising administering an effective amount of the title
 cyclic amine I [R1-R3 = H, halo, OH, alkyl, haloalkyl, alkoxy, alkylthio,
 CO2H, alkoxyalkyl, alkanoyl; W1, W2 = N or CH; X = O, NR4, CONR4, or
 NR4CO; R4 = H, alkyl, alkenyl, alkynyl, (un)substituted (hetero)aryl or
 (hetero)aralkyl; l, m, n = 0-1] or salt thereof. Preparation of the compds. I
 is described. Thus, reacting 4-(p-anisidino)-1-[[2-(3,4,5-
 trimethoxyphenyl)pyridin-4-yl]methyl] piperidine with 4-chloromethyl-2-
 (3,4,5-trimethoxyphenyl)pyridine (prepn. given) afforded 40% II. 3HCl
 which exhibited strong growth inhibitory effect on typical cultured human
 cancer cells.

GI

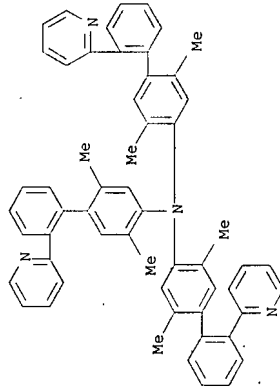

AB The invention refers to an organic electroluminescent device comprising at
least one Ph pyridine compound I [2 = n-valent bridging group or single
bond; Ar = divalent arylene; R1-8 = H or substituent wherein adjacent
groups may join to form rings; n = 2 - 6].

GI

* STRUCTURE DIAGRAM TOO LARGE FOR DISPLAY - AVAILABLE VIA OFFLINE PRINT *

AB Title compds. I [R1, R2, and R3 = independently H, alkoxy; W1 and W2 =
independently N or CH; X = O, NR4, COHR4, or NR4CO; R4 = H, alkyl, aryl,
heteroaryl, aralkyl, heteroalkyl, etc.; l, m, n = 0 or 1; and their
salts and hydrates] were prepared as cell adhesion and cell infiltration
inhibitors. For example, II-4HCl was prepared in 68% yield by
base-catalyzed condensation of (3S)-3-methylamino-1-[[2-(3,4,5-
trimethoxyphenyl)pyridin-4-ylmethyl]pyrrolidine with 4-chloromethyl-2-
(3,4,5-trimethoxyphenyl)pyridine and acidulation with HCl. Selective
invention compds. showed IC50 values of 0.04 μ M to 0.3 μ M for
inhibition of cell adhesion. I and their pharmaceutical compds. (2
examples given) are useful as anti-asthmatic agents, anti-allergic agents,
anti-rheumatic agents, anti-arteriosclerotic agents, anti-inflammatory
agents, anti-Sjogren's syndrome agents (no data).

2002: 974250 Document No. 138-55668 Preparation of piperidinylmethylpyridines
 as inhibitors of cell adhesion and cell infiltration. Kodama, Masahiko;
 Tamura, Masahiro; Oda, Toshiaki; Yamazaki, Yukiyo; Nishikawa, Masahiro;
 Takekura, Shunji. Oda, Tateshi; Yoshitani, Yoshihito; Ohnuchi, Masao (Kowa
 Co., Ltd., Japan). U.S. 6,498,194 B1, 20021124, 64 pp. Cont.-in-part of
 U.S. 6,395,753. (English). CODED: USXXAM. APPLICATION: US 2001-983928
 20011026. PRIORITY: US 2001-941634 20010830.

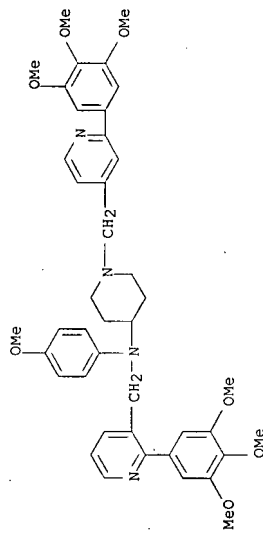

Title compds. [I: R1, R2, R3 = H, alkoxy; W1, W2 = N, CH; X = O, NR4, CONH4, NaCO4; R4 = H, alkyl, aryl, heteroaryl, aralkyl, heteroalkyl; m, n = 0, 1], were prepared. Thus, (3S)-3-[N-methyl-N-(2-nitrobenzenesulfonylamino)pyrrolidine (preparation given) and 4-chloromethyl-2-(3,4,5-trimethoxyphenyl)pyridine (preparation given)] were coupled to give (3S)-3-[N-methyl-N-(2-nitrobenzenesulfonylamino)-1-[(2-(3,4,5-trimethoxyphenyl)pyridin-4-yl)methyl]pyrrolidine (II)]. II inhibited binding of U937 cells to human umbilical venous endothelial cells (HUVEC) cultures with IC50 = 0.03 μ M. II drug formulations are given. I have inhibitory effects on both cell adhesion and cell infiltration and are useful as antiasthmatic agents, anticancer agents,

AB Tetraazafulvalenes can be cross-coupled (palladium-catalyzed) with alkenes or acetylenes. Although Suzuki conditions fail, the Heck and the Sonogashira methods are useful tools for functionalizing tetraazafulvalenes. Starting from 2,3,6,7-tetrakis(4-iodoanilino)-1,4,5,8-tetraazafulvalene, four aryl iodine atoms could be replaced by acrylic acid esters, various styrenes or cyclohexenes thus furnishing new

heterofulvalenes. Under analogous conditions, the tetraaldehyde could be obtained by employing allylic etc. as the coupling partner. Cross coupling reactions using the Sonogashira method yielded a series of highly functionalized tetraazafulvalenes. In an analogous manner, deeply colored pyrazino-fused tetraazafulvalenes as well as imidazo-fused derivs., which show strong fluorescence, were prepared. First steps towards dendritic heterofulvalenes have been realized.

* STRUCTURE DIAGRAM TOO LARGE FOR DISPLAY - AVAILABLE VIA OFFLINE PRINT *

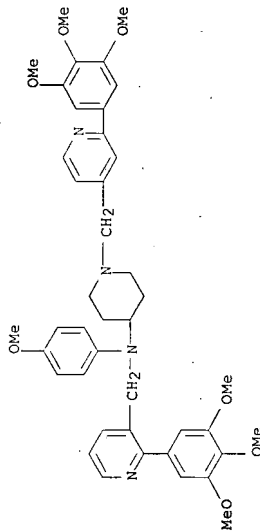

AB Title compds. I [wherein, R1, R2, and R3 = independently H, halo, OH, (halo)alkyl, alkoxy, alkylthio, carboxy, alkoxycarbonyl, or alkanoyl; W1 and W2 = independently N or CH; X = O, NR4, COMR4, or NR4CO; R4 = independently H, alkyl, alkenyl, alkynyl, or (un)substituted (hetero)aryl or (hetero)aralkyl; and m, n, and p = independently 0 or 1; or salts or hydrates thereof] were prepared as cell adhesion and cell infiltration inhibitors. For example, 1-[[2-(3,4,5-trimethoxyphenyl)pyridin-4-yl]methyl]-4-piperidine (preparation given) was reacted with p-anisidine in toluene and the resulting oil treated with NaBH3 and EtOH to give the piperidinamine (55%). N-alkylation with 3-chloromethyl-5-(3,4,5-trimethoxyphenyl)pyridine (preparation given) in the presence of K2CO3 and KI in AcCN, followed by conversion to the salt, afforded II-3HCl (5%). The latter inhibited U937 cell adhesion in TNF- α stimulated human umbilical venous endothelial cells with IC50 of 0.03 μ M. Capsule, tablet, and injection formulations containing II are provided. I are useful as anti-asthmatic agents, anti-allergic agents, anti-rheumatic agents, anti-arteriosclerotic agents, anti-inflammatory agents, anti-Sjogren's syndrome agents, and the like (no data).

AB The condensation of N,N'-tris(trimethylsilyl)amidines, e.g. I, with vinylidene salts, e.g. II (R = H, Me, OMe, OH etc.), in the presence of KF is the method of choice for the synthesis of pyrimidines. Octupoles comprising 1,3,5-benzene and triphenylamine derivs. were prepared in high yields. The latter have roughly the same lambda_max as their dipolar analogs, but have higher hyperpolarizabilities, making them promising candidates for SHG.

1994:587284 Document No. 121:187284 Immunoreactive reagents employing dihydrofolate reductase. Snow, Robert A.; Kruse, Lawrence I.; Black, Christopher D. V.; Shearman, Clyde W. (USA). PCT Int. Appl. WO 9413327 A1 19940623, 98 pp. DESIGNATED STATES: W: AU, CA, JP, US; RW: AT, BE, CH, DE, DK, ES, FR, GB, GR, IT, LU, MC, NL, PT, SE. (English). CODEN: PIXXD2. APPLICATION: WO 1993-US11842 19931206. PRIORITY: US 1992-990423 19921215.

AB This invention describes a non-radioactive targeting immunoreagent comprised of the residue of a proteinaceous active site of a dihydrofolate reductase enzyme (DHFR), a linking group, and the residue of an immunoreactive material together with a radioactive delivery agent non-covalent binding to said DHFR receptor moiety, a linking group, and the residue of a radioactive agent. This invention also describes a non-radioactive targeting immunoreagent comprised of the residue of a ligand which has an affinity for non-covalent binding to a DHFR proteinaceous active site receptor moiety, a linking group, and the residue of an immunoreactive material together with a radioactive delivery agent comprised of the residue of a DHFR proteinaceous active site receptor moiety, a linking group, and a radioactive agent. These compounds comprise useful systems for the production of an amplification of delivery of the radioactive agent to tumor sites in the therapy and diagnostic imaging of cancer.

L5 ANSWER 29 OF 31 CAPLUS COPYRIGHT 2007 ACS on STN
 1993:226641 Document No. 118:226641 Solid-phase time-resolved fluorescence
 detection of human immunodeficiency virus polymerase chain reaction
 amplification products. Bush, Charlene E.; Di Michele, Luke J.; Peterson,
 W. Rich; Sherman, David G.; Godsey, James H. (Dep. Mol. Diagn., Baxter
 Diagn. Inc., West Sacramento, Ca, 95691, USA). Analytical Biochemistry,
 202(1), 146-51 (English) 1992. CODEN: AHBGA2. ISSN: 0003-2697.
 AB A new assay system for the detection of polymerase chain reaction (PCR)
 amplification products is presented. This single-pot sandwich assay
 system employs solid-support oligonucleotide-coated capture beads, a rare
 earth metal chelate-labeled probe, and a time-resolved fluorescence
 detection. The new assay system was evaluated for various reaction
 conditions including, DNA denaturation time, hybridization salt concentration,
 probe concentration, and hybridization time, all of which are important in
 designing an assay with a high level of sensitivity for the detection of

duplex DNA. This nonisotopic assay system was applied to the detection of purified human immunodeficiency virus (HIV) DNA and sensitivity was compared with agarose gel electrophoresis and slot blot hybridization using a 32P-labeled probe. The authors were able to detect the amplified product from one copy of HIV DNA after 35 cycles of PCR amplification in less than 30 min using this assay, which compared with one copy by gel electrophoresis after 40 cycles of PCR amplification and one copy by slot blot hybridization after 35 cycles of PCR amplification and an overnight exposure of the autoradiogram. Thus, this assay is rapid, sensitive, and easy to use.

AB Oligonucleotide hybridization probes labeled with rare earth chelates of 2-alkoxy-4,6-bis(N,N,N',N'-tetraalkyl)aminotriazines **1** (R = functionalized arylalkyl; R' = (acyldicarboxypyridyl)alkyl) through a linking group (amide or thiourea) show a high efficiency of rare earth element capture and emit a high level of signal in time-resolved fluorescence spectroscopy. The oligonucleotide has **24** (preferably **212**) consecutive underivatized nucleotides complementary to the target sequence. 2-(p-Aminophenethoxy)-4,6-bis[N,N,N',N'-tetra[3-(2,4-dimethoxy-5-(2,6-dicarboxypyridyl)benzenesulfonamido)propyl]aminotriazine was converted to the corresponding isothiocyanate with CSCL2 and attached to a 35-base oligonucleotide through a 6-aminoethyl phosphate linker at the 5' end. This conjugate was used in a hybridization assay using a complementary sequence bound to polystyrene beads; after the beads were washed, Tb3+ was added and the time-resolved fluorescence of the beads was read. The signal was approx.10-fold higher than that using a closely related aminophenethoxyureido-2,4,6-(dicarboxypyridyl)benzenesulfonamidopropionylaminomethylbenzene compound
